Pointspin™

Keep your online message on-point with "hands free" web page updating.

Quick Deploy
Quickly deploy an encapsulated webserver that requires minimal configuration and maintenance.

No IT Involvement
Users can automatically publish content to static web pages themselves by placing it in a network folder

Restricted Access
Only authorized viewers can access the website through password-protected access

For Users and Groups
Web publishing for both users and groups within an Active Directory or eDirectory environment.

Management

Simplify administration, while minimizing configuration and maintenance.

The Problem

Launching and hosting a website for your company or organization can be expensive and time-consuming; however, getting online is just the first step.

You need to keep your site up-to-date with fresh, relevant content. But updating your website comes with its own set of costs, technical needs, and time demands, and if you don't have a dedicated staff to work on it, then your site will soon become stale and outdated.

Introducing Pointspin

Pointspin enables your users to easily host and publish website pages from your server-based network storage. Pointspin's encapsulated webserver engine simplifies administration, while minimizing configuration and maintenance.

Users can quickly deploy website pages and set rules to control access through password protection. Publishing and managing web content is as easy as dropping it into a folder on the network, without having to engage a network administrator for help. Once the new content is placed in the folder, Pointspin automatically updates and publishes the designated page.

Simplify your website's content management and publishing, and get your work on the web.

Pointspin™

How Pointspin Works

The Pointspin engine is an encapsulated webserver that uses a web-based administrative interface to serve up website pages that display any content located in a designated folder on your network. Once your initial configuration settings are established during installation, Pointspin requires very little administration to operate. The interface enables you to custom-configure Pointspin to meet your needs.

Content can be dropped into a user or group's home folder, or a network share assigned to the group. Pointspin publishes it automatically, with a URL based on the webserver name and folder. Each user or group can also govern access to the page content simply by making it publicly available or restricting access to require a password.

A Flexible Solution

Pointspin seamlessly integrates with other Condrey Corporation products, such as Senergy, to enhance Pointspin's capabilities. For example, working together these products enable users to:

- Automatically create the web content folders in any user or group home folders
- Set consistent rights on the content folders
- Provision an HTML template for user or group websites
- Host website content that resides in auxiliary storage locations
