

Groupsymmetry™

Align your network with next-level group storage management and access automation.

Real-Time Updates

Active Directory events trigger real-time group updates, ensuring they're always accurate and up-to-date

Automated

With automated updates, manual group management tasks and custom scripts are eliminated; letting your technical staff focus on other projects.

Increased Security

With real-time updates, you can trust that your network groups are secure, solving potential security and compliance risks.

The Problem

Group “objects” in Microsoft AD simplify network management by allowing administrators to assign access rights to a single group, applying the permissions to all members of that group, rather than assigning them individually. Group members can access shared resources and applications on the network, improving collaboration and keeping information secure and visible only to authorized users. Unless maintained and kept current, these groups can quickly become outdated and inaccurate - causing a series of security and compliance risks

Unfortunately, maintaining the integrity of network groups is typically done via complicated scripts or manual tasks that take valuable time away from your IT staff.

Management

Automatic, real-time updates to network group membership

Access

Solve security and compliance risks with confidence in your network groups

Introducing Groupsymmetry

By monitoring Microsoft Active Directory, Groupsymmetry automates group membership updates in real-time, adding or removing users according to pre-established policies and event-driven changes in network users' identities. This eliminates the need to manually modify group memberships, and ensures that your organizational groups are always accurate and up-to-date.

Save time and money while enhancing the security of your group membership

Groupsymmetry™

How Groupsymmetry Works

Groupsymmetry policies define the criteria for membership to a network group. These criteria may be any combination of network location and attribute values that the user must possess to qualify as a group member.

Groupsymmetry then monitors current Active Directory status and updates group membership when either the policy rules change or an event (such as a group member leaving) warrants a change. All group updates take place in real-time, providing a seamless transition that occurs automatically. Once a policy has been created and defined for a group, Groupsymmetry eliminates the need to manually add or remove users from a group. This saves valuable time and frees up IT staff resources to focus on other, business-critical operations. Automated, real-time group management also eliminates having to run and maintain complicated, custom-written scripts.

A Flexible Solution

Groupsymmetry also seamlessly integrates with other Condrey Corporation products, such as Senergy and Aurora, to expand their capabilities and create virtually unlimited opportunities to improve productivity and collaboration, and enhance security, while decreasing costs at the same time.
